

≡ SET UP VISUAL-NOTES ≡

A user's recipe: install once, then just ask for notes

1 PICK YOUR PATH

You use	Install with	Time
Claude Code	plugin marketplace (2 commands)	1 min
Codex, Cursor, Copilot, other agents	<code>npx skills add ...</code> (skills CLI)	1 min
claude.ai / Claude desktop	upload <code>visual-notes.zip</code> in Settings	3 min
anything that reads <code>SKILL.md</code>	copy the folder by hand	2 min

Everything lives in github.com/BinayakDotel/skills-marketplace; pick **one** path.

2 BEFORE YOU START

- ✓ **Python 3** on the machine that runs the skill
- ✓ **Chrome/Edge** (Mac, Windows) or **wkhtmltopdf** (Linux) for the PDF
- ✓ claude.ai: **Code execution** turned on
- ✓ No PDF engine? You get a printable HTML page instead

🧠 Analogy: a new recipe card

Installing adds a card to the agent's binder. It reads only the **label** (description) until you ask for notes, then opens the card and follows it.

3 INSTALL FROM THE TERMINAL

```
# Claude Code: add the marketplace once, then install the plugin
/plugin marketplace add BinayakDotel/skills-marketplace
/plugin install visual-notes@binayak-skills

# Any agent (Claude Code, Codex, Cursor, Copilot...): the skills CLI
npx skills add BinayakDotel/skills-marketplace --list
npx skills add BinayakDotel/skills-marketplace --skill visual-notes -a claude-code -g
```

`-g` = install for every project; drop it to install into the current project only.

4 CLAUDE.AI / CLAUDE DESKTOP

- Get `visual-notes.zip` (repo: `./scripts/sync-skill.sh visual-notes`)
- Settings → Capabilities → turn on **Code execution**
- Skills → **Upload skill** → pick the zip
- Switch the skill on; Claude Code sessions sync it too

5 BY HAND (ANY AGENT)

- `git clone` the `skills-marketplace` repo
- Copy `skills/visual-notes/` into your agent's skills folder
- Claude Code: `~/ .claude/skills/visual-notes/`
- Start a new session so the agent sees it

6 FIRST RUN: JUST ASK

make revision notes on Docker	one-page PDF
cheat sheet from this PDF	reads only the pages it needs
<code>/visual-notes Python lists</code>	call it by name

⚠ If it goes wrong

- **no closing** --- on upload → wrong zip; use the one the script built.
- **HTML, not PDF** → install Chrome or wkhtmltopdf.
- **Not triggering** → check it is enabled, or call `/visual-notes`.
- **Old behaviour on claude.ai** → remove the old skill, upload the new zip.

🚀 QUICK REVISION POINTS

- ✓ Claude Code: `/plugin install`.
- ✓ Other agents: `npx skills add`.
- ✓ claude.ai: upload the **zip**, code execution on.
- ✓ Needs Python 3 + Chrome for the PDF.
- ✓ Then just ask: "notes on X".
- ✓ Output: a PDF + its spec (HTML if no PDF engine).
